

**Trading Strategy: Weekly Stock Index Options Trading**

**Program Description:** The objective of the BNC WK program is to achieve capital appreciation through the speculative trading of options on the S&P 500 futures contract. This program trades weekly options of both S&P 500 Pit traded and S&P Emini futures contracts. The programs main focus is in selling puts but there will be times when calls are sold. This strategy entails a comparatively high level of risk. There will be times when BNC WK is not invested in the market at all and times it may be fully invested. The seller (writer) of an option risks losing the difference between the premiums received for the option and the price of the underlying futures contract that the writer must purchase upon exercise of the option. BNC WK will use deep out of the money put options with no intrinsic value, only time value, generally, but not always, 12%-25% away from the underlying contract's current value. The program will trade frequently as the options sold will, generally but not always, range in duration approximately 1 -20 days from expiration. Margin is expected to run at 30%. It should be noted that these are guidelines and not strict trading "rules." Determining the individual strike prices to be traded and the quantity of contracts is dependent upon proprietary information and the fivepart process explained above. When analyzing the strike price, some of the factors we take into consideration are the prices of the options, volatility and how much time remains until expiration. There is no guaranteed safe percentage that can be used consistently. For the purpose of this program all trading will be completed on exchanges located in the United States.
